

2016-2022 Monteggio, Switzerland **Pharmaceuticals**

Spray drying in pharmaceuticals requires very careful temperature control. Especially at certain stages of processing, when it is necessary to keep well below 0°C.

After careful analysis at process level, the customer selected an air-cooled chiller solution, with redundant chiller units, to produce water/antifreeze solution at -30°C.

In addition to these solutions, we have provided a user interface to remotely manage both the chillers and their settings.

Four years after the first installation, we implemented the system in 2020 with an upgrade with the same characteristics.

Currently, this company has chosen Tempco for new projects and supplies.
