

2021 Milan, Italy **Pharmaceuticals**

This company manufactures plants for processing pharmaceutical and food products. To this end, a customised, two-part solution was designed. One dedicated to the cooling of the stainless steel belts that convey and roll the products, up to the final flaking process. The other part of the project deals with the heating of the product. This is spread out on the belt in order to obtain flakes or tablets from the foil, after cooling on the belt. In addition to this is the study of the thermal and hydraulic flows and requirements of the production process. Everything is then made using stainless steel, complementing our standard machines with a customised execution that adapts to the customer's plant requirements.
