Chemistry and Petrochemistry

One of the most important companies in the metal refining and recovery sector. Constantly expanding, it needs to monitor the temperature of reactors by means of sophisticated temperature control systems.

For years, we have been supplying turnkey single-fluid temperature control units following constant design development. The realisation follows a well-defined technical specification, according to the specific needs of the customer:

- pumps with flushed seals; high resistance exchangers;
- extremely precise temperature control; high design limits;
- redundant steam condensate drainage system;
- all features that when implemented make these control units operate 24/7 with maximum efficiency and reliability.
