### **Chemistry and Petrochemistry**

A multinational chemical company contacted us to supply single-fluid temperature control units to serve reactors.

In this case, the installation had to be in an explosive zone, therefore ATEX certified.

With the customer, we opted for a pressurised water solution so that we could work over a wide temperature range.

Interestingly, in the face of a p&id and layout proposed by the parent company, the Italian subsidiary preferred to adopt Tempco's standard solutions, presenting them to their US colleagues as a successful case history in reactor processing temperature control.
