

2019 Milan, Italy **Metallurgy**

A worldwide producer of special steels, this company has a division that deals with production/processing plants in the chemical/food sector.

Specifically, these are flaking plants for food chemicals.

We have designed and manufactured steel conveyor belt cooling systems for the products.

The material arriving from the production line is usually hot and creamy, and is deposited on the steel belt, which, suitably cooled, causes it to solidify. The product is then detached from the belt using various processes to achieve the desired end result.

All cooling and thermostating is carried out on skids matched to the individual systems, which, depending on the area of installation, may also require ATEX certification.
