Metallurgy

Aluminium is an almost obligatory choice when it comes to lightweight, strong and non-corrodible structures.

This company has been operating worldwide for several years, providing integrated surface treatment systems for aluminium profiles.

For as many years we have been working together, where we supply the cooling and chemical treatment part of the water that feeds the plants. Starting with reverse osmosis softeners, dosing systems, evaporative towers, skid-mounted pumping units, heat exchangers and control systems designed for cooling furnaces and finished products. Tempco supplies the entire cooling system, including filtration systems and support for the development of the correct operation logic.
