Rubber and Plastics

This company is active in the business of land and submarine cables and systems for the transmission and distribution of energy, both for applications in various industries and in construction and infrastructure. For telecommunications, it produces cables and accessories for voice, video and data transmission, with various solutions.

In cable production, as in tyre production, the correct thermal level is crucial. For a plant in Romania, we supplied all the temperature control units for moulds and extrusion lines for rubber and insulating coatings. We have met the customer's needs with a range of control units from 6 KW to 52 KW of heating output, complete with cooling section, all with pressurised water at a working temperature of 130°C, with control of the heating elements driven by static relays.
