Textile

A technological branch of the company historically involved in the production of yarns and fabrics, this division deals with the design and retrofitting of textile plants, with a particular focus on energy saving. A long-standing partnership that allows us to follow developments in this sector in detail.

The applications are the most diverse, the research more and more driven, with the sole aim of increasing the energy performance of plants. Among the latest realisations are work on loom rooms and air conditioning systems carried out in northern Italy.
