Palermo Airport, Sicily

Energy Production

Supply of an electro-radiator for heat dissipation of emergency generator sets, serving the Palermo airport. The radiators are made with dual circuitry, for cooling both the jacket and the after-cooler of the endothermic engine. They are also equipped with low-noise fans, prepared for inverter control. The supply also includes expansion tanks for the glycol solution, with corresponding level alarms. Depending on the installation area, the radiant pack is made with special pre-painted fins with protection for marine environments.
